

OpenSeesPL – 3D Pile-Ground Interaction

Jinchi Lu

University of California, San Diego

jinlu@ucsd.edu

Ahmed Elgamal

Zhaohui Yang

Thomas Shantz

September 3, 2010

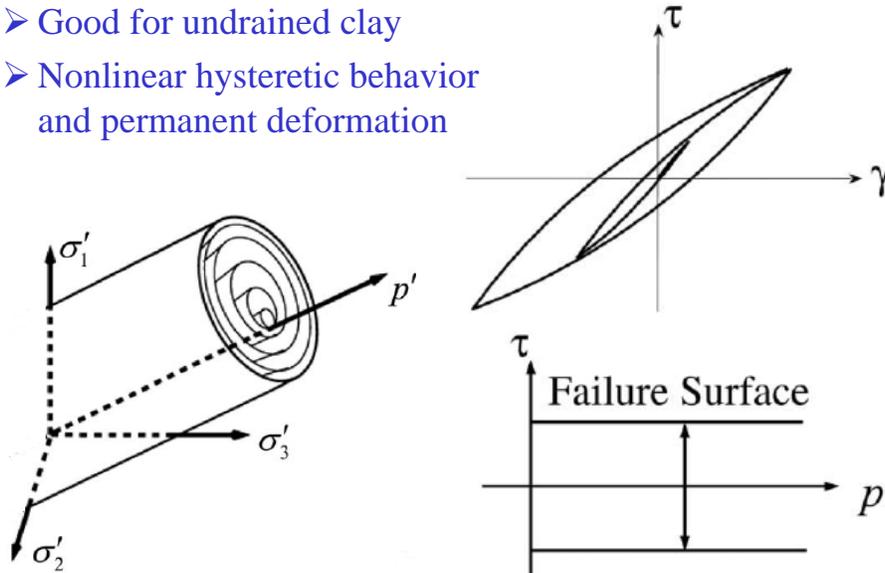

Outline

- Soil constitutive models
- Solid-fluid fully-coupled elements
- OpenSeesPL graphical user interface
- Examples of using OpenSeesPL
- Ongoing research projects

Pressure-Independent Material

- Good for undrained clay
- Nonlinear hysteretic behavior and permanent deformation

PressureIndependentMultiYield

```

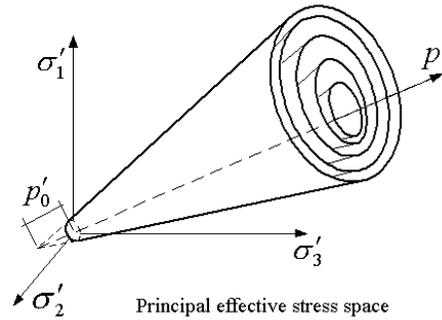

nDmaterial PressureIndependentMultiYield $tag $nd $rho $refShearModul
$refBulkModul $cohesi $peakShearStra <$frictionAng=0. $refPress=100.
$pressDependCoe=0. $noYieldSurf=20 <$r1 $Gs1 ...> >
    
```

Suggested parameter values:

	Soft Clay	Medium Clay	Stiff Clay
<i>rho</i>	1.3 ton/m ³ or 1.217x10 ⁻⁴ (lbf)(s ²)/in ⁴	1.5 ton/m ³ or 1.404x10 ⁻⁴ (lbf)(s ²)/in ⁴	1.8 ton/m ³ or 1.685x10 ⁻⁴ (lbf)(s ²)/in ⁴
<i>refShearModul</i>	1.3x10 ⁴ kPa or 1.885x10 ³ psi	6.0x10 ⁴ kPa or 8.702x10 ³ psi	1.5x10 ⁵ kPa or 2.176x10 ⁴ psi
<i>refBulkModul</i>	6.5x10 ⁴ kPa or 9.427x10 ³ psi	3.0x10 ⁵ kPa or 4.351x10 ⁴ psi	7.5x10 ⁵ kPa or 1.088x10 ⁵ psi
<i>cohesi</i>	18 kPa or 2.611 psi	37 kPa or 5.366 psi	75 kPa or 10.878 psi
<i>peakShearStra</i>	0.1	0.1	0.1

Pressure-Dependent Material

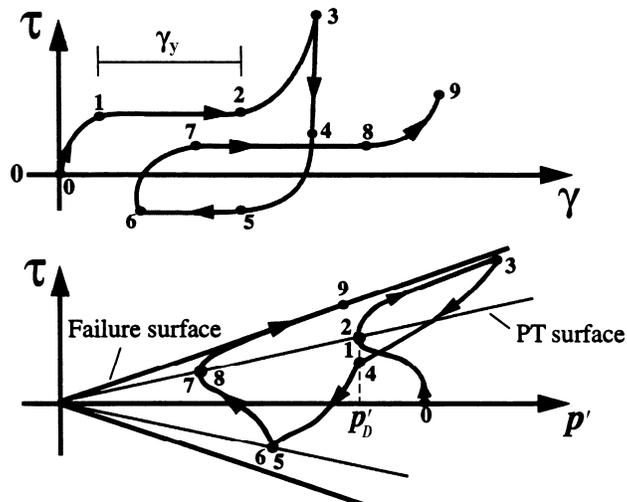

- Multi-yield surface plasticity model (based on Prevost 1985)

Conical yield surfaces for granular soils (Prevost 1985; Elgamal et al. 2003; Yang and Elgamal 2008)

Pressure-Dependent Material (cont)

- Incorporating dilatancy and cyclic mobility effects

Shear stress-strain and effective stress path under undrained shear loading condition (Parra 1996, Yang 2000, Yang and Elgamal 2002)

PressureDependMultiYield

```
nDMaterial PressureDependMultiYield $tag $nd $rho $refShearModul
$refBulkModul $frictionAng $peakShearStra $refPress
$pressDependCoe $PTAng $contrac $dilat1 $dilat2 $liquefac1
$liquefac2 $liquefac3 <$noYieldSurf=20 <$r1 $Gs1 ...> $e=0.6 $cs1=0.9
$cs2=0.02 $cs3=0.7 $pa=101 <$c=0.3>>
```

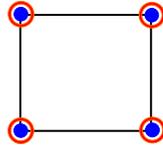

Suggested parameter values:

	Loose Sand (15%-35%)	Medium Sand (35%-65%)	Medium-dense Sand (65%-85%)	Dense Sand (85%-100%)
<i>rho</i>	1.7 ton/m ³ or 1.59x10 ⁻⁴ (lbf)(s ²)/in ⁴	1.9 ton/m ³ or 1.778x10 ⁻⁴ (lbf)(s ²)/in ⁴	2.0 ton/m ³ or 1.872x10 ⁻⁴ (lbf)(s ²)/in ⁴	2.1 ton/m ³ or 1.965x10 ⁻⁴ (lbf)(s ²)/in ⁴
<i>refShearModul</i> (at <i>p'_r</i> =80 kPa or 11.6 psi)	5.5x10 ⁴ kPa or 7.977x10 ³ psi	7.5x10 ⁴ kPa or 1.088x10 ⁴ psi	1.0x10 ⁵ kPa or 1.45x10 ⁴ psi	1.3x10 ⁵ kPa or 1.885x10 ⁴ psi
<i>refBulkModu</i> (at <i>p'_r</i> =80 kPa)	1.5x10 ⁵ kPa or 2.176x10 ⁴ psi	2.0x10 ⁵ kPa or 2.9x10 ⁴ psi	3.0x10 ⁵ kPa or 4.351x10 ⁴ psi	3.9x10 ⁵ kPa or 5.656x10 ⁴ psi
<i>frictionAng</i>	29	33	37	40
<i>peakShearStra</i> (at <i>p'_r</i> =80 kPa)	0.1	0.1	0.1	0.1

Solid-Fluid Fully-Coupled Elements (*u-p* formulation)

- quadUP
- 9_4_QuadUP
- brickUP
- 20_8_BrickUP

2D Solid-Fluid Coupled Element

- Solid nodes: describe the solid translational degrees of freedom
- Fluid nodes: describe the fluid pressure

quadUP

```
element quadUP $eleTag $iNode $jNode $kNode $lNode $thick $matTag
$bulk $fmass $hPerm $vPerm <$b1=0 $b2=0 $t=0>
```

Recorder examples:

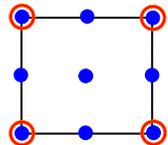

Pore water pressure:

```
recorder Node <-file $fileName> <-time> <-node ($nod1 $nod2 ...)> -dof 3 vel
```

Stress:

```
recorder Element <-file $fileName> <-time> <-ele ($ele1 $ele2 ...)> material 1 stress
```

2D Solid-Fluid Coupled Element

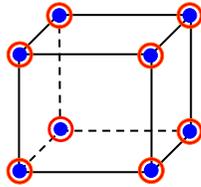

- Solid nodes: describe the solid translational degrees of freedom
- Fluid nodes: describe the fluid pressure

9_4_quadUP

```
element 9_4_QuadUP $eleTag $Node1 $Node2 $Node3 $Node4 $Node5
$Node6 $Node7 $Node8 $Node9 $thick $matTag $bulk $fmass $hPerm
$vPerm <$b1=0 $b2=0>
```

- Recommended to ensure numerical stability in case of liquefaction analyses (Babuska-Brezzi condition)

3D Solid-Fluid Coupled Brick Element

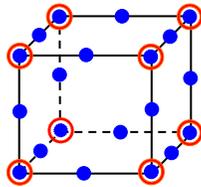

brickUP

- Solid nodes: describe the solid translational degrees of freedom
- Fluid nodes: describe the fluid pressure

```
element brickUP $eleTag $Node1 $Node2 $Node3 $Node4 $Node5
$Node6 $Node7 $Node8 $matTag $bulk $fmass $PermX $PermY
$PermZ <$bX=0 $bY=0 $bZ=0>
```

3D Solid-Fluid Coupled Brick Element

20_8_BrickUP

- Solid nodes: describe the solid translational degrees of freedom
- Fluid nodes: describe the fluid pressure

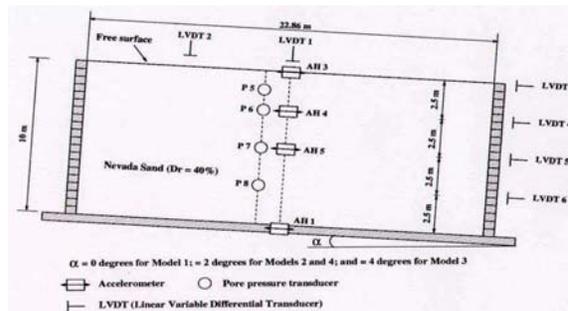

```
element 20_8_BrickUP $eleTag $Node1 ... $Node20 $matTag $bulk
$fmass $PermX $PermY $PermZ <$bX=0 $bY=0 $bZ=0>
```

- 20-node element is recommended to ensure numerical stability in case of liquefaction analyses (Babuska-Brezzi condition)

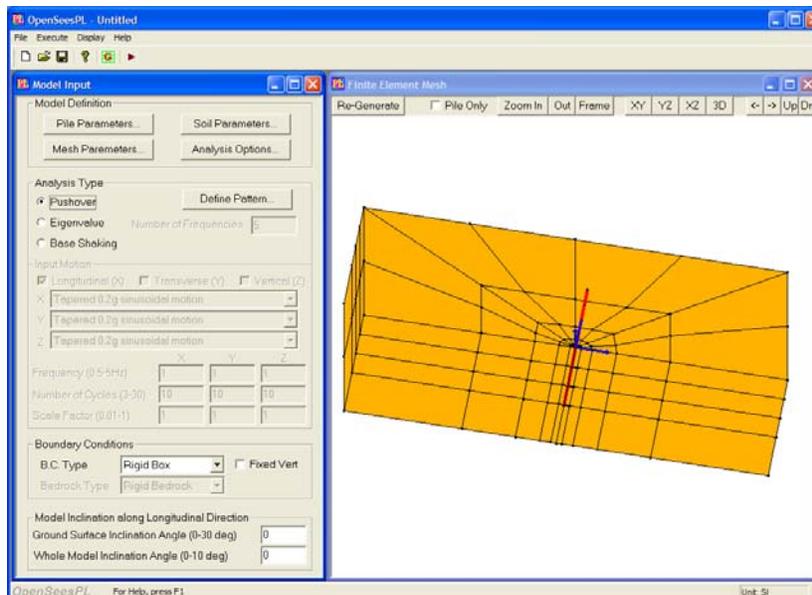

Soil Model Calibration

- The pressure-dependent material model has been extensively calibrated for clean Nevada Sand at $D_r \approx 40\%$ (Parra 1996; Yang 2000)
- Calibration was based on results of:
 - Monotonic and cyclic laboratory tests (Arulmoli et al. 1992)
 - Centrifuge experiments (VELACS Models 1 & 2, Dobry et al. 1995; Taboada 1995)

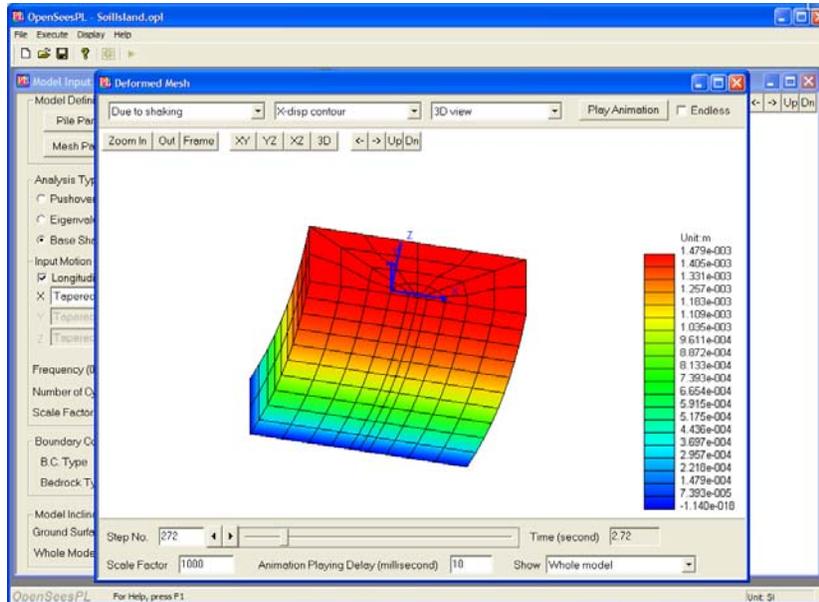

VELACS Models

OpenSeesPL Graphical User Interface

Example 2: Stone Column Ground Modification

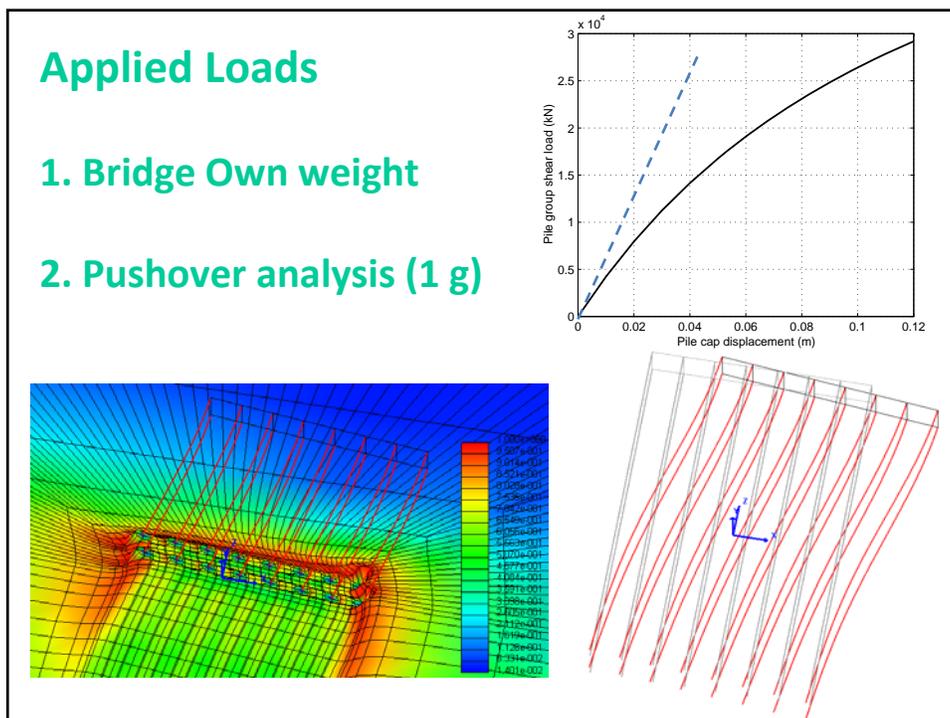

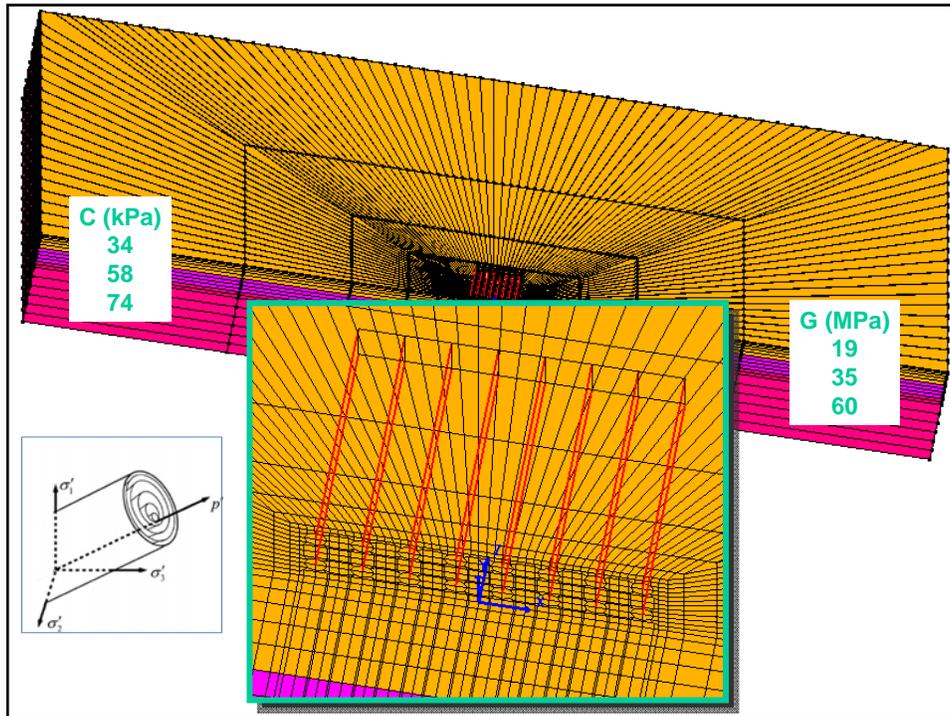

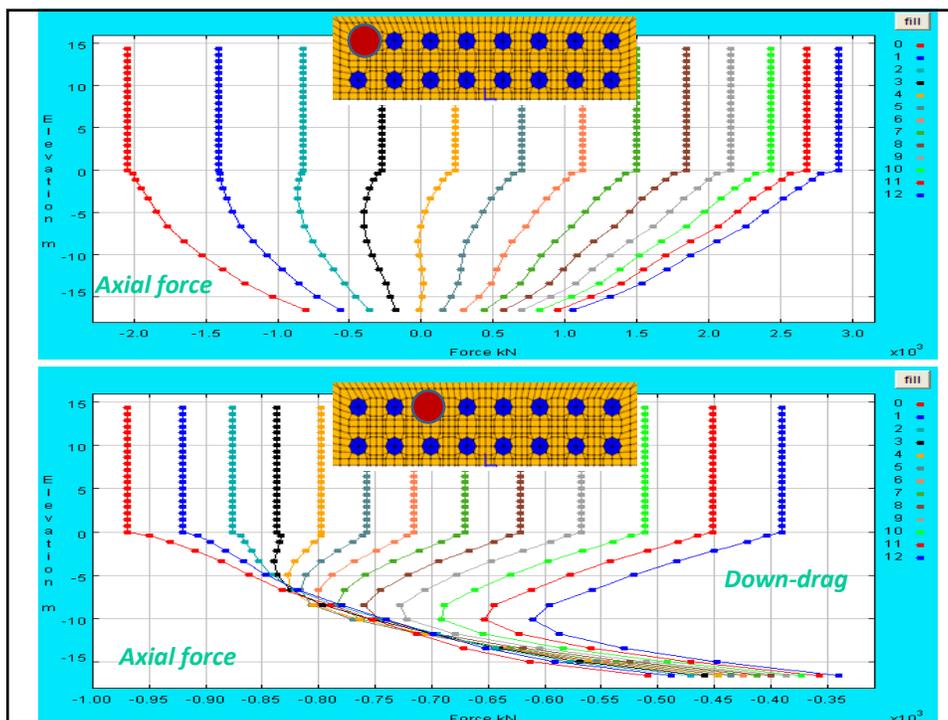

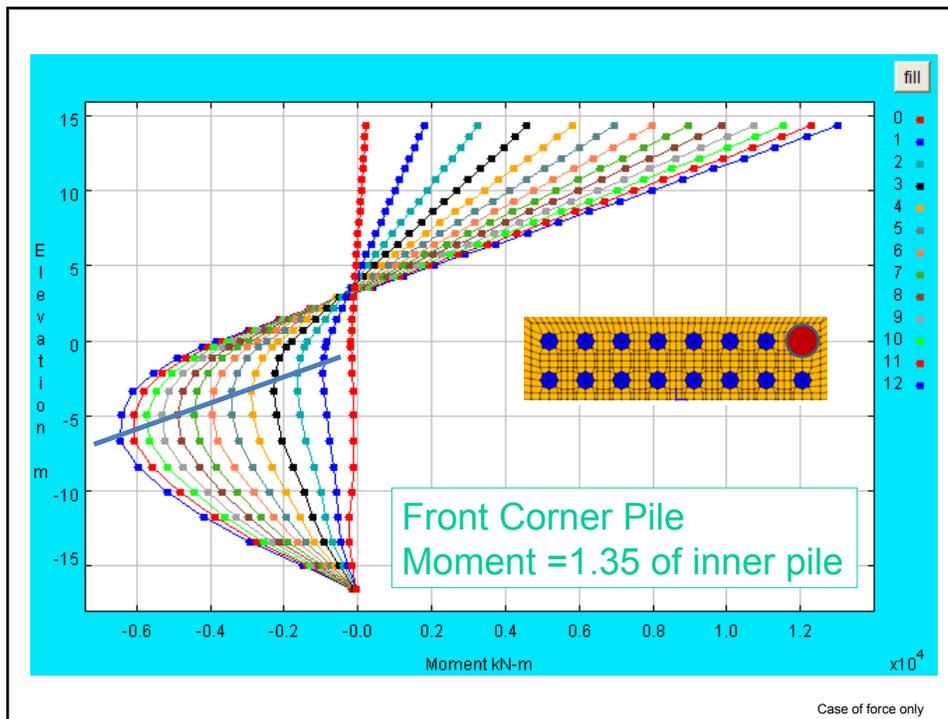

Example 3: Large Pile Group

8 x 4 Pile Group in Half Mesh

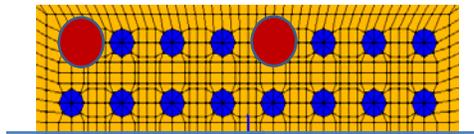

Summary for Pile Group Study

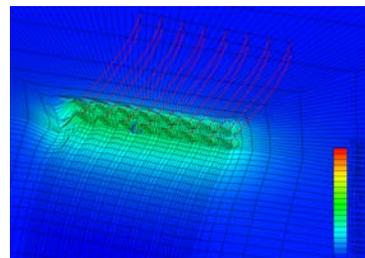

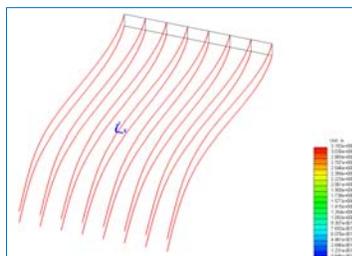

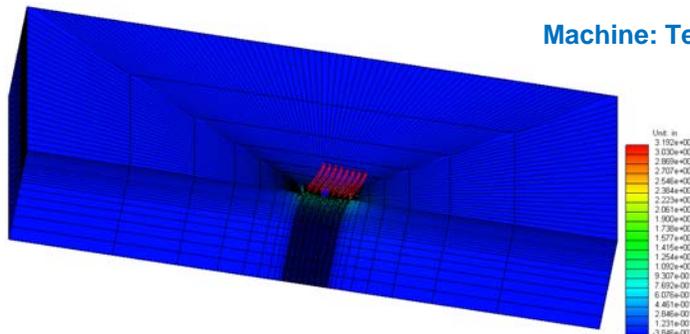

For the employed *cohesive soil* scenario:

- Corner piles are most vulnerable
- Edge piles carry much more axial load than inner piles
- Axial response and skin friction (t-z springs) may play a critical role
- Pile tensile forces may be quite significant and affect RC response (connection to pile-cap, reduction in confinement)
